

Amendments to the Specification

Please amend paragraph [0027] as follows:

Media servers ~~26~~ 28 provide media processing under control of a media gateway controller (not shown). The media server ~~26~~ 28 could provide, for example, voice storage and responses for voice mail, or video streams.

Please amend paragraph [0032] as follows:

In operation, when there is activity on the graphical interface of the monitored terminal 32a, the graphical proxy 34 sends graphical commands to both the monitored terminal 32a and the monitoring terminal 32b. From the viewpoint of the user of the monitored terminal ~~34a~~ 32a, operation of the telephone is normal, and the user interacts with the user interface to operate the device 32a to create and terminate connections with other devices in the telecommunications network 8. Additionally, the monitored terminal 32a may send presence information, discussed below, to the graphical proxy 34.

Please amend paragraph [0085] as follows:

In addition to monitoring interaction of the graphical interface for telephonic conversations, the monitoring terminal could also perform presence monitoring. In presence monitoring, the monitoring terminal 32b can receive information on the identity of any persons using the ~~monitoring~~ monitored terminal 32a and the times of such use, how the ~~monitoring~~ monitored terminal is used (i.e., what programs were used), and the identities of parties in communication with the ~~monitoring~~ monitored terminal 32a, including web sites, new groups, other data networks, intermediate sites providing communication between two users, and other persons. The presence information can be transferred to the monitoring terminal 32b via the graphical proxy 34. The monitoring terminal 32b could use the presence information, for example, to indicate whether a co-worker is in his/her office, in a telephonic conversation, or otherwise occupied.
